+ Summarize open gaps for a client email

Agent plan & activity

Goal: prepare an AWS migration proposal

- Read 3 documents and your questionnaire answers; extracted 12 requirements.
  This morning
- Saw your note about the Q3 deadline and marked the migration timeline as time-boxed.
  This morning
- Mapped 6 requirements to AWS services; applied 4 automatically at high confidence.
  10:42 AM
- Drafting the proposal — architecture diagram and cost comparison section.
  In progress
- Will ask for your one approval before this can go to the client.
  Next

1 approval needed

The agent has applied AWS recommendations and drafted the full proposal. Nothing reaches Northwind Retail until you approve it.

Discovery questionnaire — Azure to AWS migration

12 of 18 answered

Fill this in yourself from the discovery call — it's your working notes, never sent to the client.

Which Azure services are currently in use (VMs, App Service, SQL DB, etc.)?

Azure VMs (Windows Server), Azure SQL Database, App Service for the customer portal, Blob Storage for product images.

What is the primary driver for this migration (cost, performance, contract end, compliance)?

Azure enterprise agreement renews in Q3; also evaluating cost and wants better autoscaling for seasonal traffic.

Are there any regulatory or data residency constraints? Not captured yet

Not yet captured — fill it in from your notes once you've asked, or have the agent draft a first pass.

Ask the agent to draft this from your documents →

Notes & instructions for the AI

2 added

Add context, corrections or directives. These aren't chat — they become explicit, cited input the analysis draws on and shows back to you.

- Treat the Q3 contract renewal as a hard migration deadline. ×
- Client's technical lead prefers PostgreSQL-compatible options where possible. ×

Type your own note or instruction…

Add

Quick add

+ Prioritize fully managed AWS services over self-managed alternatives.
+ Treat data residency as a hard requirement, not a preference.
+ Assume minimal downtime tolerance during cutover.

Northwind Retail

Cloud migration — Azure to AWS

Stage: Recommendations

Overview | Inputs & Discovery | AI Analysis | Recommendations | Proposal | Team & Access

The agent mapped **6 of the 8** well-supported requirements to AWS services and **applied 4 automatically** at high confidence — no need to confirm each one. **2** are on hold until the ERP protocol and data-residency questions are answered — see AI Analysis. Everything applied can still be overridden, and the whole set gets one final approval before it reaches the client — see Proposal.

Requirement

Legacy ERP integration — protocol unspecified

On hold

No recommendation yet — the integration protocol (SOAP, REST or file-based) isn't confirmed. Recommending an integration pattern now would be a guess.

Go answer this in AI Analysis

Requirement

Customer portal — Azure App Service, autoscaling disabled

Confidence: Medium

Azure App Service → AWS Elastic Beanstalk + Application Auto Scaling

App Service is a managed PaaS for web apps — Elastic Beanstalk is the closest managed match on AWS and adds the autoscaling this requirement asks for directly.

Estimated impact: scaling down during off-peak months typically lowers compute spend versus App Service's fixed 2-instance baseline. Directional only — not a priced quote.

`Current-State-Architecture.pdf · p.2` `Questionnaire · Q2`

✓ Applied by agent

Override

Requirement

Azure SQL Database, ~800GB, no read replicas

Confidence: High

Azure SQL Database → Amazon RDS for SQL Server, Multi-AZ + 1 read replica

A direct managed-database equivalent. A read replica offloads reporting queries the questionnaire mentioned running against production.

`Current-State-Architecture.pdf · p.3`

✓ Applied by agent

Override

Requirement

Product images — Azure Blob Storage

Confidence: High

Azure Blob Storage → Amazon S3 + Amazon CloudFront

Object storage with a CDN in front reduces origin load for a retail catalog with predictable traffic spikes.

needs your review reviewed

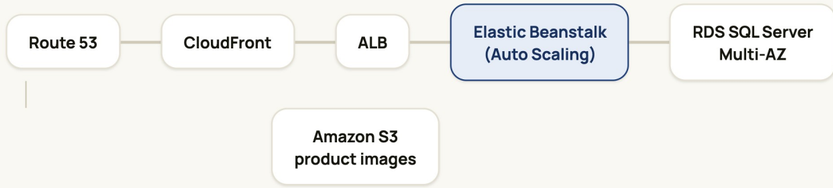

Executive summary

Reviewed

Northwind Retail currently runs its customer portal on Azure App Service with a fixed two-instance footprint, backed by Azure SQL Database and Blob Storage. With the Azure enterprise agreement renewing in Q3, this is a natural point to move to AWS. We recommend a direct managed-service migration — Elastic Beanstalk with autoscaling, RDS for SQL Server, and S3 with CloudFront — that resolves the seasonal traffic problem the team called out and is expected to reduce fixed compute costs during off-peak months.

Recommended AWS architecture

Needs your review

AI-proposed layout from the confirmed recommendations. Boxes and connections are editable directly on the canvas.

Service mapping & cost comparison

Reviewed

CURRENTLY ON AZURE	RECOMMENDED ON AWS	ESTIMATED IMPACT
App Service (2 fixed instances)	Elastic Beanstalk + Auto Scaling	Lower off-peak spend
Azure SQL Database	RDS for SQL Server, Multi-AZ	Comparable, +HA

BATTLECARDS

Responding to "we're already committed to Azure EA"

Proposed by Arjun S.

Approve Reject

How the agent uses this

Published entries are pulled in automatically during analysis and recommendations — cited like a source document, on every engagement.

A pending entry stays invisible to the agent until it's approved, so a wrong assumption can't reach a client's proposal.

All · 8 | Rules & standards · 2 | Case studies & proposals · 2 | AWS reference · 2 | Battlecards · 2

Showing 8 entries.

RULES & STANDARDS — Published

Always prefer fully managed AWS services over self-managed

Default to managed offerings (RDS, Fargate, App Runner) unless the client explicitly needs infra-level control.

TR Tanmaya R. · 3 weeks ago — Cited 42×

RULES & STANDARDS — Published

Treat data residency as a hard requirement in regulated industries

Healthcare, finance and government clients: never propose a region without confirming residency constraints first.
